Communicate CARE
Guidance for person-centred care of adults with intellectual and developmental disabilities

Introduction
This tip-sheet offers guidance to family physicians, nurses, allied health professionals for a person-centred health assessment of adults with intellectual and developmental disabilities. It provides information on best practices to prepare for appointments, communicate and plan interventions using a person-centred approach to shared decision making.

Prepare to Communicate CARE

Know your patient
- Review available patient information and plan to accommodate needs (e.g., physical, cognitive, communication).
- Involve the patient as much as possible.

Create a safe and comfortable space
- Modify possible stressors that can make the patient feel uncomfortable or unsafe (e.g., commotion, lights, smells).

Accommodate needs
- Book preferred appointment times.
- Plan for longer and several appointments.
- Determine and adapt to how the patient communicates (verbal, non-verbal, devices).

Establish rapport and set an agenda
- Welcome and introductions.
- Be present with a warm and positive regard.
- Explain that you will engage directly with the patient and will include caregivers for information or translation.
- Ask a few simple introductory questions; maybe attend to the patient’s piece of clothing or what they brought with them.
- Ask whether the patient wants their caregiver to stay for all or part of the visit.
- Set an agenda for the visit.
- Consider rapport-building visits outside of problem-solving visits, for anxious patients.
Communicate CARE: Clearly, Attentively, Responsively, Engaging with the patient and others as needed

**Communicate Clearly**
- Use verbal and nonverbal communication aligned with the patient profile and needs (e.g., use gestures, writing, drawing, and pictures).
- Assume better receptive than expressive language ability, especially with severe or profound intellectual and developmental disability.
- Slow down, pause frequently, and confirm understanding. Repeat and rephrase as needed.
- Use short, simple, and plain language.
- Avoid abstract language, medical jargon, and idioms (e.g., “your throat is on fire”).
- Use clear sentences such as “Show me...”, “Tell me...”, and “Do this...”.
- Avoid abstract concepts (e.g., indicate time by referring to specific past or present events like breakfast, summer, holidays).

**Attentively listen and observe**
- Assume a relaxed disposition (e.g., breathe slowly), sit facing the patient, attentively listen, and observe body language.
- For patients with delayed processing, allow ample time to respond to questions (e.g., 10 seconds or more).
- Be sensitive to cues, tones, and silences (e.g., if bored or restless, consider transition to physical exam; if anxious, alleviate concerns; if silent, explore whether they are upset).
- Seek clarification when you do not understand the patient.
- For patients with atypical muscle tone or motor functioning, interpreting facial expressions or body language might be difficult.
- Engage caregivers to understand the patient’s experience.
- Allow the patient to confirm and supplement their information.

**Responsively address concerns during the healthcare visit**
- Respond to verbal and nonverbal expressions of concern with empathy and adjust the approach as necessary.
- Be curious. The history and physical examination are useful to assess the patient’s mental processes and their physical or emotional discomfort.
- Enhance the examination and physical exam with words, actions, miming, or audiovisual aids.
- A systems examination can target priority areas for a focused physical exam.
- Physical examinations can be difficult due to sensory, physical, or trauma-related issues. Respond to concerns with explanation (verbal and nonverbal).
- Caregivers may be helpful to guide and facilitate your inquiry and actions.
- Collaborate with the patient: Ask permission and offer choices (e.g., “Is it okay if we do your blood pressure now?”, “Should I listen first to your heart or look in your ears?”).
- Indicate what will happen next. Let the patient first handle and explore equipment before you use it.
- Go slow and check in often (e.g., respond to changes in affect by asking, “Are you okay?”).
- Leave sensitive areas of the examination until the end (e.g., ears).
- Prioritize or defer examination and investigations.

**Engaging the patient and others as needed**
- Engage the patient and others, as indicated throughout the healthcare visit (e.g., interpret patient communications, goals, and preferences).
- Use a decision-making tool to decide on the decision-making process.
- This process involves sharing information, explaining findings, and discussing options with the patient always at the centre.
- Once the decision-making process is established, develop a care plan that includes the condition, action, who is responsible, and timeline.
- Provide a copy of the care plan to track management plan progress and follow-up.
- Engage the patient in planning the follow-up visit.
